[Handouts 1 and 2,](#)  
 last 3 pages of:  
 \*[Miscellaneous Mt. Lemmon-related information](#) \*

2

Debate 20 Sept 2007: **Slight Schedule Change:**  
 Should the flat-tailed horned lizard (*Phrynosoma mcallii*) be ESA listed?

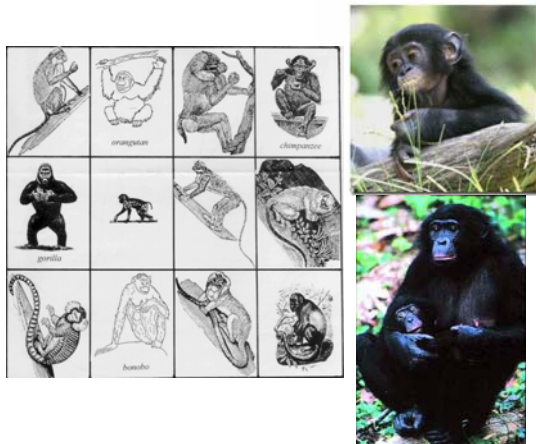

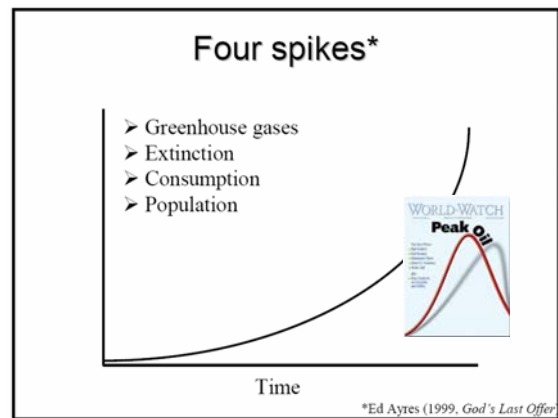

Three groups – one will debate, another will evaluate, third will observe, then we rotate.

406

Debate 1 (20 Sept.)  
 Group A debate  
 Group B evaluate  
 Group C observe  
 Debate 2 (23 Oct.)  
 Group A observe  
 Group B debate  
 Group C evaluate  
 Debate 3 (15 Nov.)  
 Group A evaluate  
 Group B observe  
 Group C debate

Debate 1 (20 Sept.)  
 506 A assist  
 506 B assist  
 506 C observe  
 Debate 2 (23 Oct.)  
 506 A observe  
 506 B assist  
 506 C assist  
 Debate 3 (15 Nov.)

A U.S. Geological Survey report released in November 2006 indicated that the Beaufort Sea polar bear population has experienced a significant drop in cub survival. The study also determined that adult males weighed less and had smaller skulls than those captured and measured two decades ago.

In recent years, winter sea ice has fallen by at least 600,000 square miles, double the size of Texas.

*Ursus maritimus*

Conservationists hope — and Alaska business interests fear — that designating polar bears as threatened due to global warming will carry a huge economic cost, forcing federal agencies around the country to consider the affect on polar bears before granting permits that would increase greenhouse gas emissions.

Arizona Daily Star, 10 April 2007

Published: 09.08.2007

New forecast: Two-thirds of polar bears could die off  
THE ASSOCIATED PRESS

WASHINGTON — Two-thirds of the world's polar bears will be killed off by 2050 — and the entire population gone from Alaska — because of thinning sea ice from global warming in the Arctic, government scientists forecast Friday. Only in northern Canada and northwestern Greenland are polar bears expected to survive through the end of the century, said the U.S. Geological Survey, which is the scientific arm of the Interior Department.

USGS projects that polar bears during the next half-century will lose 42 percent of the Arctic range they need to live in during summer in the Polar Basin when they hunt and breed. A polar bear's life usually lasts about 30 years.

7

## Biodiversity (Biological Diversity)

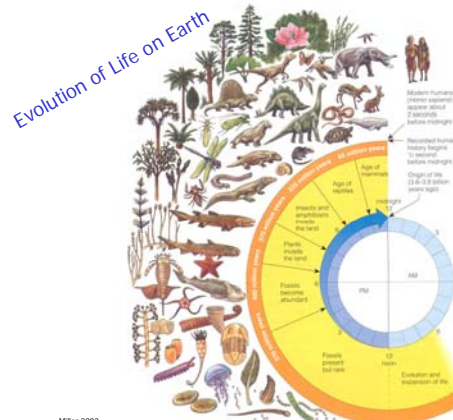

“structural and functional variety of life forms at genetic, population, community, and ecosystem levels”

8

*Nothing in biology makes sense except in the light of evolution.*

THEODOSIUS DOBZHANSKY

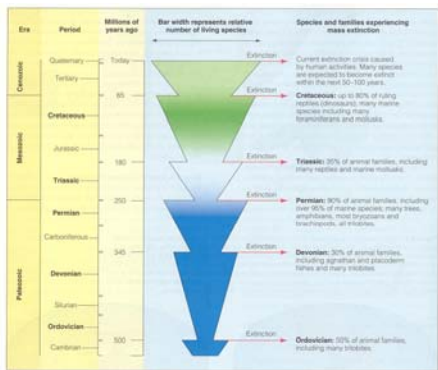

9

Miller 2003

Figure 5.8 Greatly simplified overview of the biological evolution of life on the earth, which was provided by

10

Miller 2003

Figure 5.9 Fossils and radiocarbon dating indicate that five major mass extinctions (indicated by arrows) have taken place over the past 500 million years. Mass extinctions have large numbers of organisms (see Figure 5.8) unaccounted for and create new ones. As a result, each mass extinction has been followed by periods of recovery (represented by the wedge shapes) called adaptive radiations. During these periods, which last over 50 million years or more, new species evolve to fill new or vacated ecological roles (niches). Many experts believe that we are now in the midst of a sixth mass extinction, caused primarily by human activities.

## Major Extinction Events

Figure 2.5 Diversity of marine families from the Cambrian to the present. The asterisks mark the five major mass extinction events.

Groom et al. 2006

Figure 2.6 Terrestrial plant species richness. Ferns, gymnosperms, and angiosperms have, in turn, dominated the world's flora. (Modified from Sencer 1996.)

Figure 2.7 Extinctions of families through geologic time. The five historical mass extinction events are marked with an asterisk.

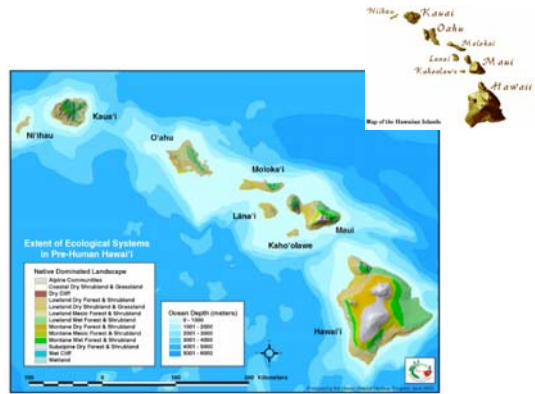

## Adaptive Radiation

**Figure 5-10** Adaptive radiation of mammals began in the first 10–12 million years of the Cenozoic era (which began about 65 million years ago) and continues today. This evolution of a large number of new species is thought to have resulted when huge numbers of new and vacated ecological niches became available after the mass extinction of dinosaurs near the end of the Mesozoic era. ### Hawaiian Endangered Species

Unfortunately, Hawai'i has the highest number of listed threatened and endangered species in the nation. There are 394 threatened and endangered species in the State of Hawai'i, of which 294 are plants, 57 invertebrates, and 43 vertebrates.

## What is biodiversity?

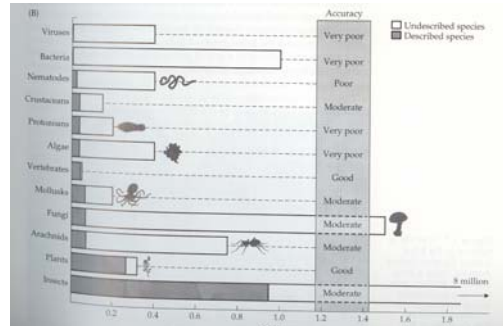

Primack 2006, Fig 3.6

18

## How many species on earth?

Primack 2006, Fig 3.6

## Research Focus?

FIGURE 3.10 For five groups of Chilean animals, the cumulative percentage of the known species described from 1750 to 2000. Note that the majority of birds and mammals were largely described by 1900, and probably few new species remain to be discovered. In contrast, polychaete worms and bark lice were largely neglected by early taxonomists and are only now being investigated and described. Amphibians are intermediate in their intensity of study. (After Primack et al. 2001.)

Primack 2006

21

22

## Biodiversity

1. Genetic (nat. sel.)

2. Species

3. Ecological forests, deserts, lakes, wetlands, reefs etc.

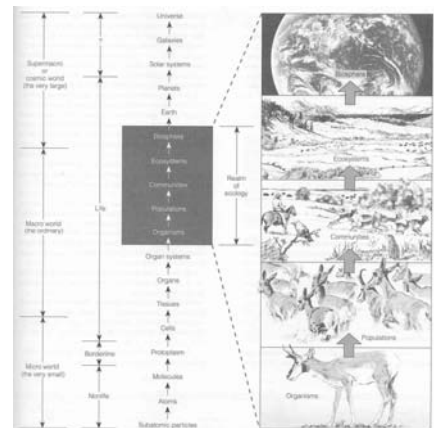

4. Functional energy flow nutrient cycling etc.

23

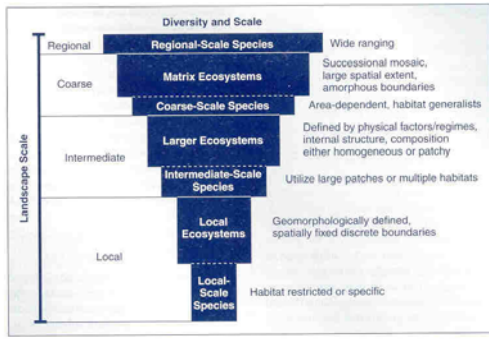

Levels of Biological Organization.

Scaling.

Miller, 2003

Figure 2-4 Levels of organization of matter in nature. Notice the five levels that ecology focuses on.

**Where is biodiversity?**

One tree in Peru with same ant diversity as Britain

Pimm and Jenkins 2005

**Species Richness and Latitude**

**FIGURE 3.5** In North America, as in all the continents, the numbers of bird, tree, and mammal species increase toward the Tropics. The numbers of species indicated in the bar graphs correspond to latitude in the map at left. Tree species diversity is not available for some lower latitudes. (From Briggs 1995.)

Primack 2006

28

**Altitude?**

**Figure 4.12**  
Latitudinal patterns in species richness from tropical to temperate regions. In most taxa the number of species increases from temperate to tropical regions.  
Van Dyke 2003  
After Reid and Miller (1989). Reprinted from Huston (1994).

29

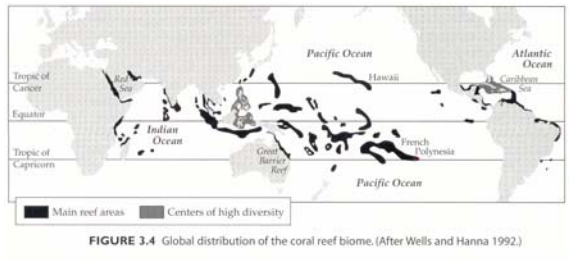

**Tropical Rainforests**

Primack 2006

**FIGURE 3.1** Tropical rain forests are found predominantly in wet, equatorial regions of America, Africa, and Asia. Eight thousand years ago, tropical forests covered the entire shaded area, but human activities have resulted in the loss of a great deal of forest cover, shown in the darkest shade. In the lighter shaded area forests remain, but they are no longer true tropical forests; instead they are (1) secondary forests that have grown back following cutting, (2) plantation forests such as rubber and teak, or (3) forests degraded by logging and fuelwood collection. Only in the regions shown in black are there still blocks of intact natural tropical forest large enough to support all of their biodiversity. (After Bryant et al. 1997.)

## Coral Reefs

Primack 2006

31

## Lissamphibia

### Urodela (salamanders)

10 families, 60 genera, 516 spp.

Pough et al. 2004

34

## Urodela families

Pough et al. 2004

Figure 3-7 Distribution of the salamander families Plethodontidae and Proteidae.

## What factors correlated with high diversity?

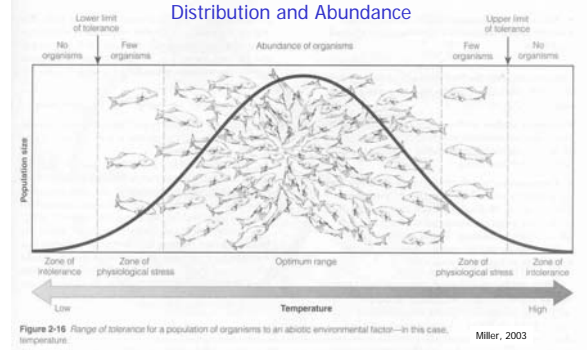

- Energy
- Precipitation
- Temperature
- Area
- Habitat heterogeneity (e.g., foliage height and birds)
- ~Stable environment
- Moderate (intermediate) disturbance level (shifting mosaic, no climax)

36

## Distribution and Abundance

Other Miller 2003  
**Figure 4-12** Key physical and chemical or abiotic factors affecting terrestrial ecosystems (left) and aquatic life zones (right).

**Figure 2-16** Range of tolerance for a population of organisms to an abiotic environmental factor—in this case, temperature. Miller, 2003

## Range of tolerance of abiotic factor(s)

38

## Terrestrial Biomes

(Forest, Desert, Grassland, Tundra, etc.)  
 Biotic (~Vegetative) Communities

### Climate

1. Temperature
2. Precipitation
3. Soil type

- Latitude
- Altitude

**Figure 4-8** Major biomes found along the 38th parallel across the United States. The differences reflect changes in climate, mainly differences in average annual precipitation and temperature (not shown). Miller 2003 3-5

**Figure 2-4** Biomes and climate. Distributions of the major biomes are plotted on axes of mean annual precipitation. Within the region bounded by the dashed line, factors such as seasonality of drought, fire, and grazing strongly affect which type of vegetation is present (Modified from Whittaker 1970).

Groom et al. 2006

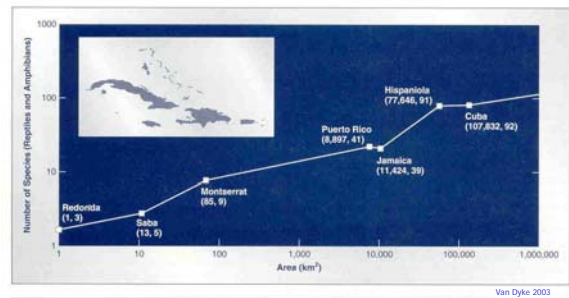

40

## Threats to biodiversity – habitat loss

Thanks to Chuck Price

41

**Figure 4.4** A general species-area relationship among some Caribbean islands. Note that species richness on islands increases with increasing area. Based on data from Darlington (1957:483).

## Species-Area Relationship

42

**Figure 4.5**  
An illustration of the relationship between area and species richness of (a) grasshoppers and (b) all small mammal species in woodlots (crosses) and contiguous forest sites (squares). Species richness increases with woodlot area. In (a), note that grasshopper species richness increases with area more rapidly in contiguous forest than in woodlots. This pattern suggests that species richness not only declines with habitat loss, but also with habitat fragmentation.  
After Napp and Swihart (2003).  
Van Dyke 2003

### Species-Area Relationship

$$S = cA^Z$$

S = species richness  
c = taxon-specific constant  
A = area  
Z = extinction coefficient for taxon

### 3 step loss of biodiversity (Rosenzweig)

1. Endemics
2. Sink populations
3. Stochasticity

Therefore end up with lower steady state species richness and loss of biodiversity

### Woodlots vs. contiguous forest

43

44

**Figure 4.6**  
When the size of a natural area is decreased, the first species lost are endemics. Next, sink species (those that are not reproducing fast enough to replace themselves) go extinct locally. Finally, failure to replace accidental losses fast enough brings the province to a still lower steady state of biodiversity.  
After Rosenzweig (1999).  
Van Dyke 2003

**Figure 4.7**  
The "cookie cutter" model of the effects of habitat loss on endemic species. If the cookie cutter strikes at subarea A, seven species lose habitat but none is exterminated. In contrast, if the cookie cutter strikes subarea B, on one containing species with more restricted ranges, seven species lose habitat, and four species are exterminated. Thus, random habitat loss produces a disproportionately high rate of extinction in endemic species.  
After Pimm (1998).  
Van Dyke 2003

Endemics  
Habitat Size  
Habitat Loss

46

Species Focus ---> Biodiversity and Process Focus (ESA)

What being lost vs. why...

Species = ?

Biological Species Concept (Mayr)  
"a group of interbreeding populations that are reproductively isolated from other such groups"

- 2-morphological/typological species concept (plants)
- 3-evolutionary species concept
- 4-genetic species concept
- 5-paleontological species concept
- 6-cladistic species concept

47

48

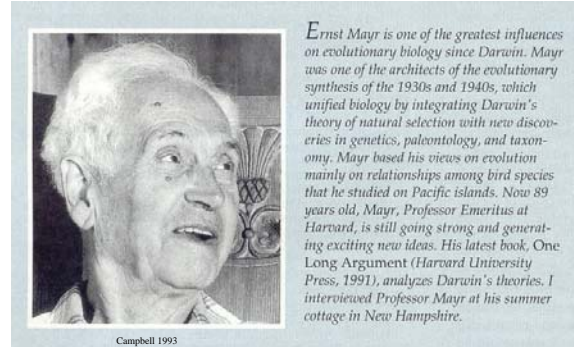

**Biological Species Concept**

1. Testable and operational
2. Definition compatible with established legal concepts
3. Focus on level of biodiversity that agrees with tradition of conservation

**Conserve Species as**

**TYPES**  
or as  
**EVOLUTONARY UNITS**

49

Campbell 1993

Ernst Mayr is one of the greatest influences on evolutionary biology since Darwin. Mayr was one of the architects of the evolutionary synthesis of the 1930s and 1940s, which unified biology by integrating Darwin's theory of natural selection with new discoveries in genetics, paleontology, and taxonomy. Mayr based his views on evolution mainly on relationships among bird species that he studied on Pacific islands. Now 89 years old, Mayr, Professor Emeritus at Harvard, is still going strong and generating exciting new ideas. His latest book, *One Long Argument* (Harvard University Press, 1991), analyzes Darwin's theories. I interviewed Professor Mayr at his summer cottage in New Hampshire.

Ernst Mayr (1904-2005)  
Published papers for > 80 years

50

Figure 22.3 Ernst Mayr in New Guinea, 1927. During his expedition, the naturalist (on the right, photographed with his guide) was struck by the almost exact match in how he and the native Papuans divided the birds of the Arakak Mountains into separate species. It was one of many experiences that led to Mayr's biological species concept, which emphasizes interbreeding within species and reproductive isolation between species.

You've also written that we humans have extraordinary responsibility because of our uniqueness as a species. Yes, humans are basically responsible for all the bad things that at the present time happen to our planet, and we are the only ones who can see all these things and do something about them. If we would stop the human population explosion, we would have already won two-thirds of the battle. That we live here just as exploiters of this planet is an ethic that does not appeal to me. Having become the dominant species on our planet, we have the responsibility to preserve the well-being of this planet. I feel that it should be a part of our ethical system that we should preserve and maintain and protect this planet that gave origin to us.

Ernst Mayr interviewed in Campbell 1993

**Galapagos Finches**

**Brassica oleracea**

Figure 17-8 A number of common vegetables are members of the same species, *Brassica oleracea*, including cauliflower, broccoli, cabbage, brussels sprouts, and kale. Artificial selection is responsible for the variation shown within this species. (Raymond Teichert)

Measuring Biodiversity

- alpha
- beta
- gamma

Alpha

species within a community

community

- all populations occupying a given area at a given time
- often broken into taxonomic groups or functional roles

- 1) Species Richness (# of species)
- 2) Species Evenness (how many of each type?)

Shannon Diversity Index (richness and evenness)

$$H' = -\sum_i p_i \ln(p_i), (i = 1, 2, 3 \dots S)$$

$p_i$  = proportion of total community abundance represented by  $i$ th species

Northern bobwhite	—	2.64
Shannon diversity ( $H'$ )	1.64	2.25

Shannon Index in Tallgrass Prairie

(Indiv spp abundance relative to total abundance)

What if removed three species from B?

**Figure 4.3** Total species diversity can be measured as the product of the number of functional types and the number of species per functional type. Two populations may have the same species diversity and still differ. For example, one may have many functional types and few functional analogs, and the other may have many analogs but few functional types. The relative number of functionally analogous species within each functional type is indicated by the width of the oval. Van Dyke 2003

Process and Pattern

- 1 Functional Types
- 2 Functional Analogs

Increase either to increase biodiversity

Which to preserve?

Niche: Ecological role of a species in a community

Measuring Biodiversity

- alpha
- beta
- gamma

Beta

area or regional diversity (beta richness)  
diversity of species among communities across landscape

gradient

- slope, moisture, temperature, precipitation, disturbance, etc.

Whittaker's Measure =  $(S/\alpha) - 1$

where S = # spp in all sites, alpha = avg. # spp/site

- a) if no community structure across gradient = 0  
-broad ecological tolerances, niche breadth

- b) 100/10 - 1 = 9 high beta diversity

Beta Diversity

- 1) quantitative measure of diversity of communities that experience changing environmental gradients
- 2) are species sensitive, or not, to changing environments?  
are there associations of species that are interdependent (plants, pollinators, parasites, parasitoids)?
- 3) how are species gained or lost across a TIME gradient?

Succession, community composition, effects of disturbance

## Alpha and Beta Diversity Hotspots

Figure A Hot spots of rarity and species richness in the lower 48 United States. Read as a topographic map with concentric circles showing higher values of the rarity-weighted species richness index (RWRI). Hotspots are found in CA, the Death Valley region of Nevada, the Appalachian Mountains, and the Florida panhandle and Everglades. Many other regions of higher diversity are found in other parts of the U.S., and the Hawaiian Islands (not shown) have the greatest concentration of range-restricted species by far. To achieve a high RWRI both  $\alpha$ - and  $\beta$ -diversity must be high. (Modified from Stein et al. 2000.)

Groom et al. 2006

61

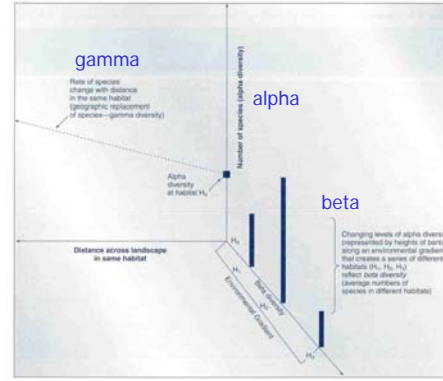

Figure 4.2 The number of species on a given site in one kind of habitat is a measure of alpha diversity (species richness). The average number of species per site along an environmental gradient (number of species per habitat) is a measure of beta diversity. The rate of species change over landscape-scale distances in the same habitat is a measure of gamma diversity (geographic replacement of species).

Van Dyke 2003

62

### Measuring Biodiversity

- alpha - beta - gamma

#### Gamma

rate of change of species composition with distance  
(geography, rate of gain and loss of species)

alpha rarity with increased number of species  
(fewer of each type)

beta rarity with habitat specialists

gamma rarity if restricted to particular geographic areas

63

### Measuring Biodiversity

- alpha - beta - gamma

#### Missing?

Species role in ecosystem?

Rarity

Phylogenetic Representation

Ecological Redundancy

Edges vs. Interior (e.g., fragmentation)

(spp richness increases, but are broad generalists, not interior habitat specialists)

All species are not equivalent (normative valuation?)

64

VanDyke 2003

*Cyprinodon macularius*  
Desert Pupfish

Photograph Courtesy of John Rinne

Desert pupfish declined due to the introduction and spread of exotic predatory and competitive fishes, water impoundment and diversion, water pollution, groundwater pumping, stream channelization, and habitat modification.

Healthy population of almost 10,000 fish inhabits this oasis. This last refuge of a unique fish is being actively managed.

*Cyprinodon macularius*

**Desert Pupfish**

Family Cyprinodontidae

- 1-1/4 inches long  
max. age of three years
- females are gray and drab  
males are bluish, turning bright blue during spring breeding season.
- feed on insect larvae and other organic matter from pond bottom.
- prefer shallow pond depths, about 12 to 18 inches deep.

Quitobaquito pupfish (Endangered since 1986)

This tiny fish was once part of a widespread population, the range of which included the Colorado, Gila, San Pedro, Salt and Santa Cruz rivers and their tributaries in Arizona and California. The ancestors of the Quitobaquito and Sonoyta river pupfish are believed to have been cut off from their relatives in the Colorado River drainage about one million years ago.

The warm, slightly brackish water at Quitobaquito is ideal habitat for pupfish. Pupfish can tolerate salinity levels ranging from normal tap water to water three times saltier than the ocean. Therefore, they are well suited to desert environments where high evaporation rates create water with high salinity levels.

Although the water temperature at the spring is a constant 74°F, the water temperature in the pond fluctuates greatly during the year, from about 40°F or cooler in January to almost 100°F in August, especially in shallow areas... very tolerant of rapid temperature change and low oxygen content due to summer heat.

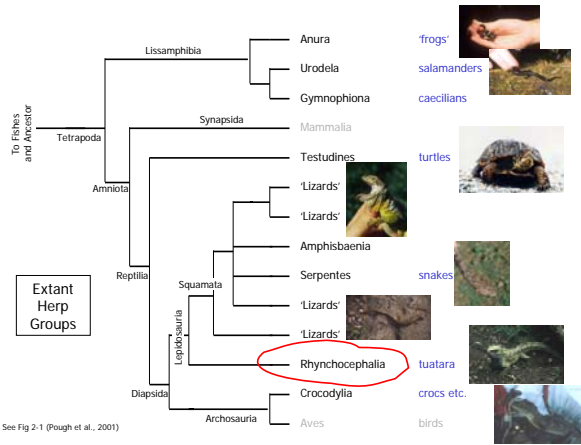

Pricing Biodiversity

$$R_i = (D_i + U_i)(\Delta P_i/C_i)$$

- D = distinctiveness
- U = utility
- Δ P = enhanced probability of survival
- C = cost of strategy

See Fig 2-1 (Pough et al., 2001)

**Rhynchocephalia**

- evolved before dinosaurs
- world-wide distribution in Mesozoic
- most extinct at end Cretaceous (65mya)

**Sphenodontidae**  
- 1 extant genus (*Sphenodon*)  
- 2 extant species

- restricted to small islands of New Zealand
- long lived
