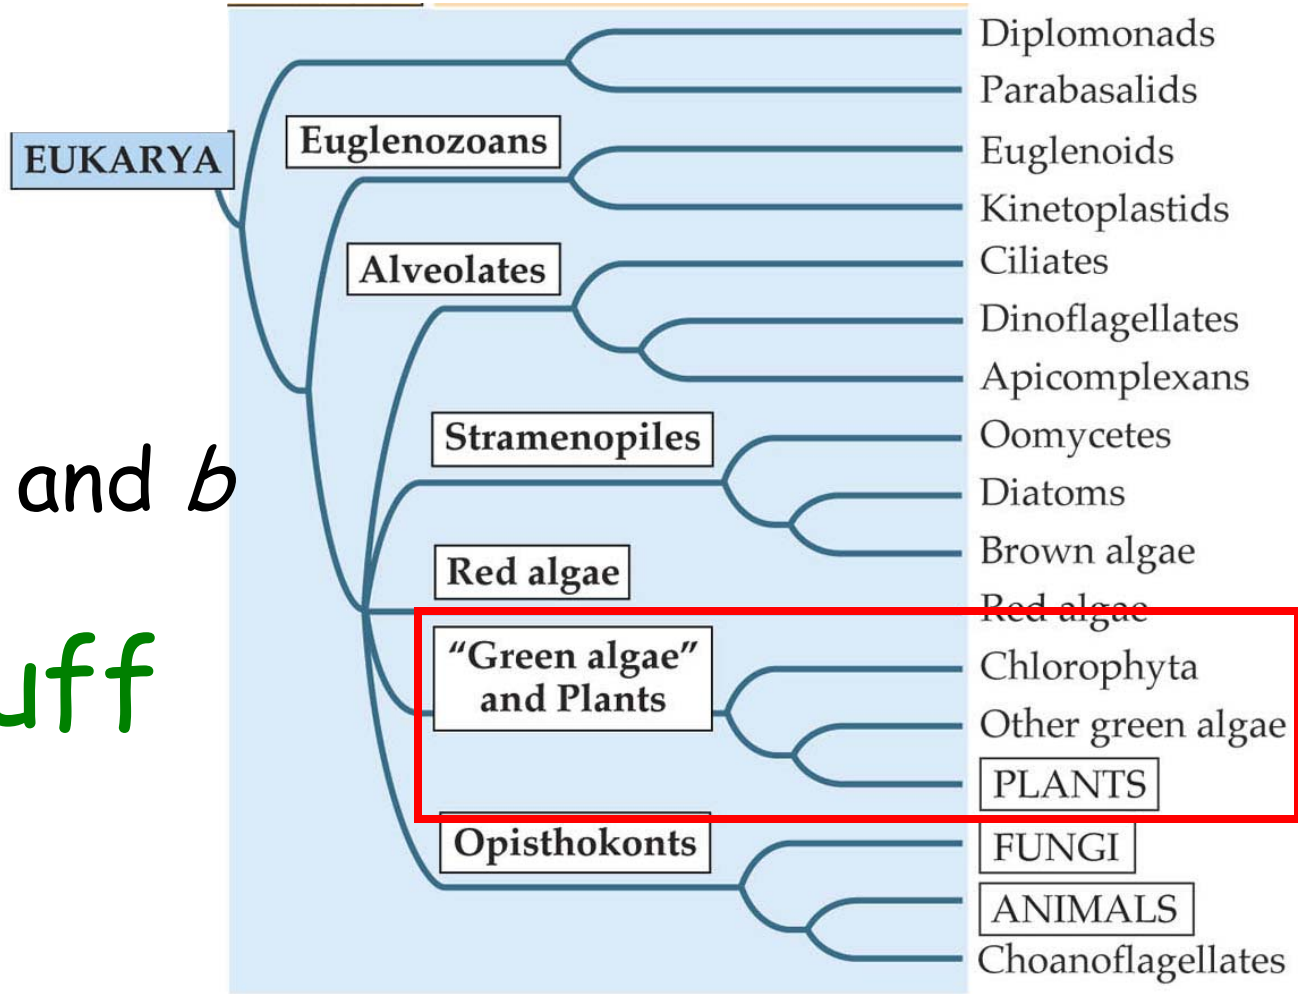
The Evolution of Land Plants

(from the edge of the swamp…)

- chlorophylls *a* and *b*

Green stuff



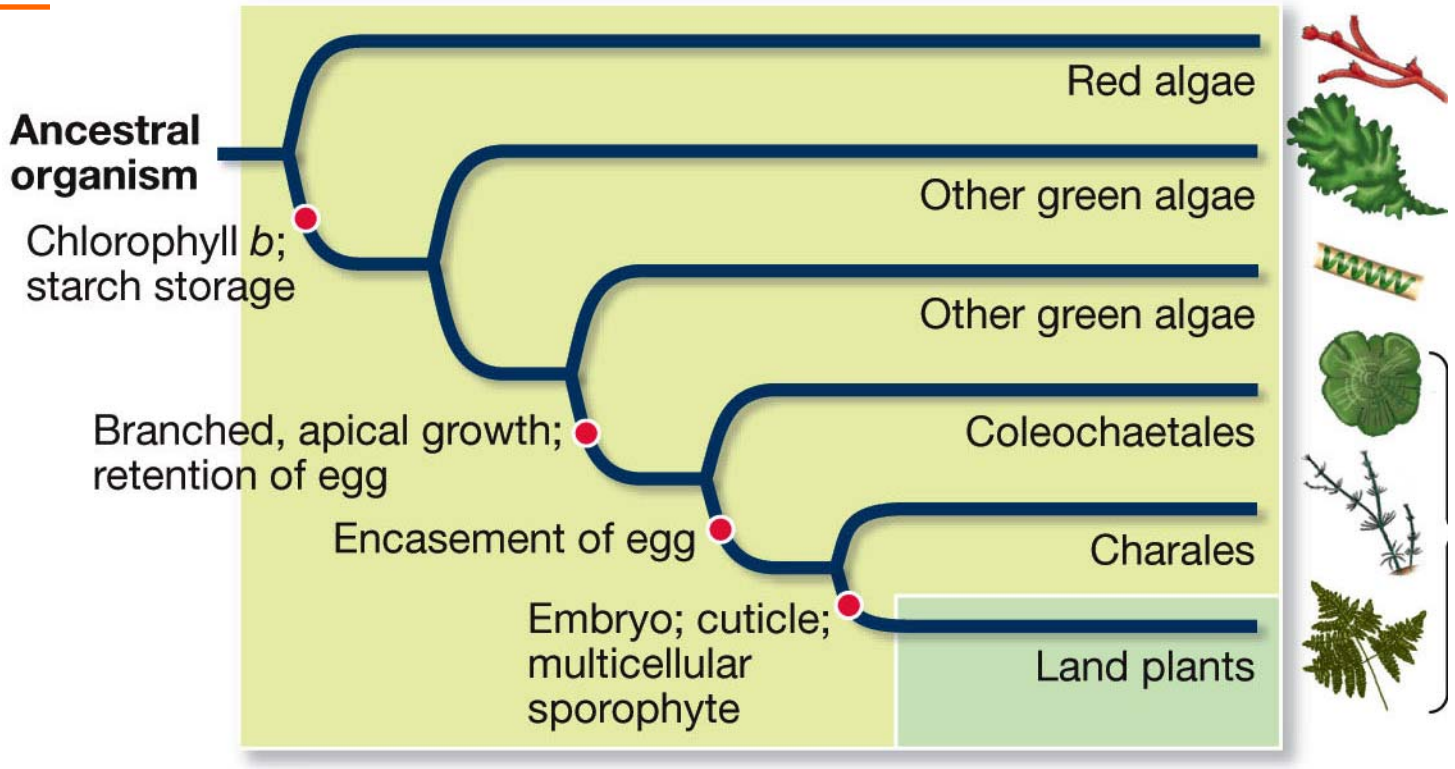
Original Land Plants Related to Algae

Land plants retain derived features they share with green algae (*Charales*):

_____ and _____

_____ as a storage product.

_____ in cell walls.



Land Plants are Monophyletic

Land plants are monophyletic, all descend from a single common ancestor.

One synapomorphy: development from an embryo protected by tissues of the parent plant. Therefore, also called embryophytes.

(*phyton* = plant)

Land Plants Comprise ~Ten Clades

Nonvascular (3 clades)

-paraphyletic group

-liverworts,

-hornworts

-mosses

Vascular plants, or *tracheophytes* (7 clades)—all have conducting cells called -**tracheids**.

-monophyletic group

Moving to Land

Plants first appeared on land between 400-500 million years ago.

Environmental Challenges:

1.
2. transport to all parts
3. (fight gravity)
4. disperse .

Some challenges met immediately, others took millions of years

Biological history

Plants first appeared on land between 400–500 million years ago.

22.1 Earth's Geological History *(Part 2)*

ERA	PERIOD	ONSET	MAJOR EVENTS IN THE HISTORY OF LIFE
Cenozoic	Quaternary	1.8 mya[a]	Humans evolve; many large mammals become extinct
	Tertiary	65 mya	Diversification of birds, mammals, flowering plants, and insects
Mesozoic	Cretaceous	144 mya	Dinosaurs continue to diversify; flowering plants and mammals diversify. **Mass Extinction** at end of period (≈76% of species disappear)
	Jurassic	206 mya	Diverse dinosaurs; radiation of ray-finned fishes
	Triassic	248 mya	Early dinosaurs; first mammals; marine invertebrates diversify; first flowering plants; **Mass Extinction** at end of period (≈65% of species disappear)
Paleozoic	Permian	290 mya	Reptiles diversify; amphibians decline; **Mass Extinction** at end of period (≈96% of species disappear)
	Carboniferous	354 mya	Extensive "fern" forests; first reptiles; insects diversify
	Devonian	417 mya	Fishes diversify; first insects and amphibians. **Mass Extinction** at end of period (≈75% of species disappear)
	Silurian	443 mya	Jawless fishes diversify; first ray-finned fishes; plants and animals colonize land
	Ordovician	490 mya	**Mass Extinction** at end of period (≈75% of species disappear)
	Cambrian	543 mya	Most animal phyla present; diverse algae
Precambrian		600 mya	Ediacaran fauna
		1.5 bya[a]	Eukaryotes evolve; several animal phyla appear
		3.8 bya	Origin of life; prokaryotes flourish
		4.5 bya	

[a]mya, million years ago; bya, billion years ago.

First hominids

Homo sapiens

Adaptations for Land

1. Cuticle
   - waxy covering that retards water _____
2. Gametangia enclosing gametes
3. Embryos in a protective structure
4. Pigments that protect against UV radiation
5. Spore walls containing sporopollenin
   - resists desiccation and _____
6. Mutualistic relationships with fungus
   - to promote _____ from soil

Plants Help Create Soil

Ancient plants contributed to soil formation.

Acids secreted by plants help break down rock.

Organic material from dead plants contributes to soil structure.

Create habitat and pave way for succession of other species.

Nonvascular Plants Are Similar to Ancestral Land Plants

Today's nonvascular plants are thought to be similar to the first land plants.

They grow in moist environments in dense mats

They are small, there is no system to conduct water from soil to plant body parts.

mosses

Traits of Nonvascular Plants

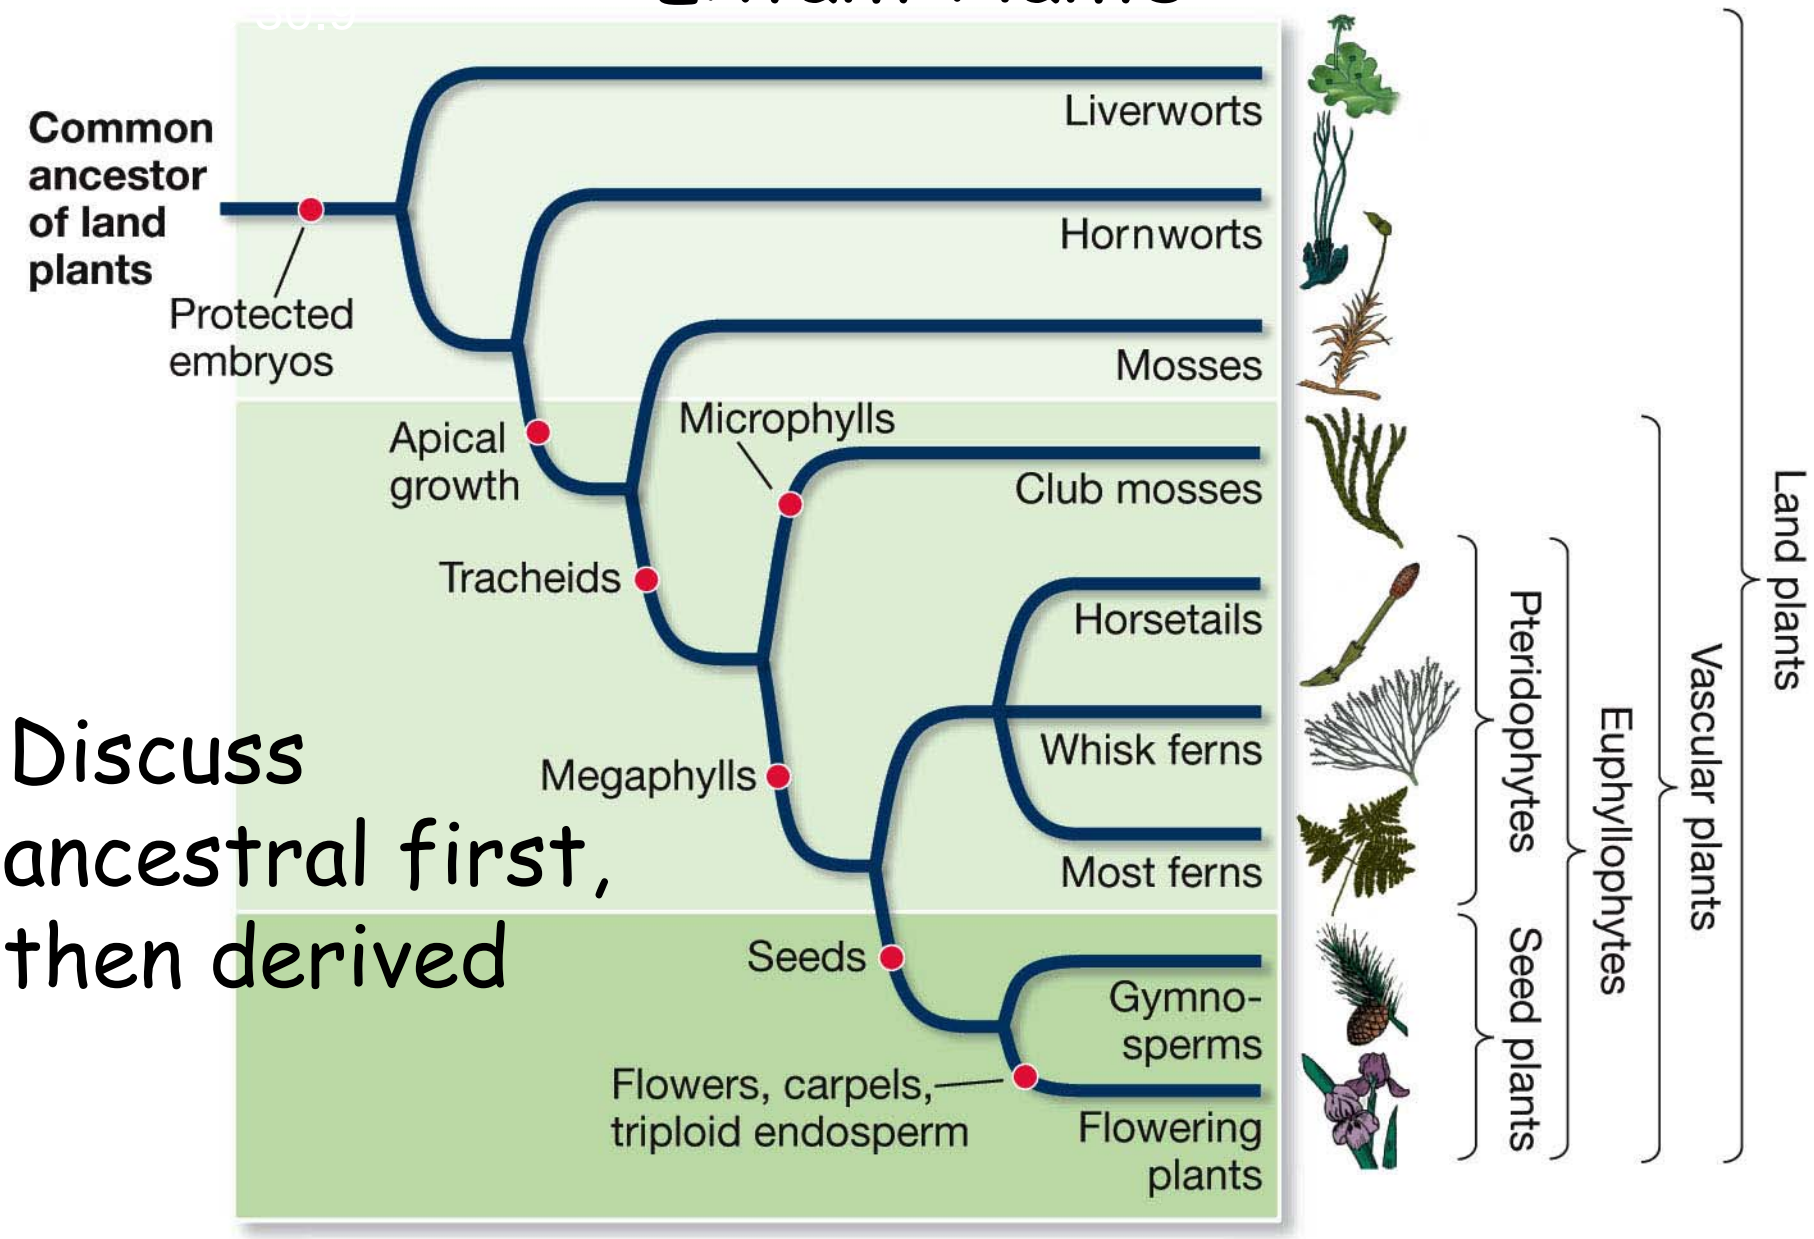
Growth pattern of nonvascular plants allows water to move through mats by capillary action.

Minerals can be distributed through the small plants by diffusion.

Mutualistic relationship with fungi called glomeromycetes which promote absorption of water and minerals.

mosses

Extant Plants



Discuss ancestral first, then derived

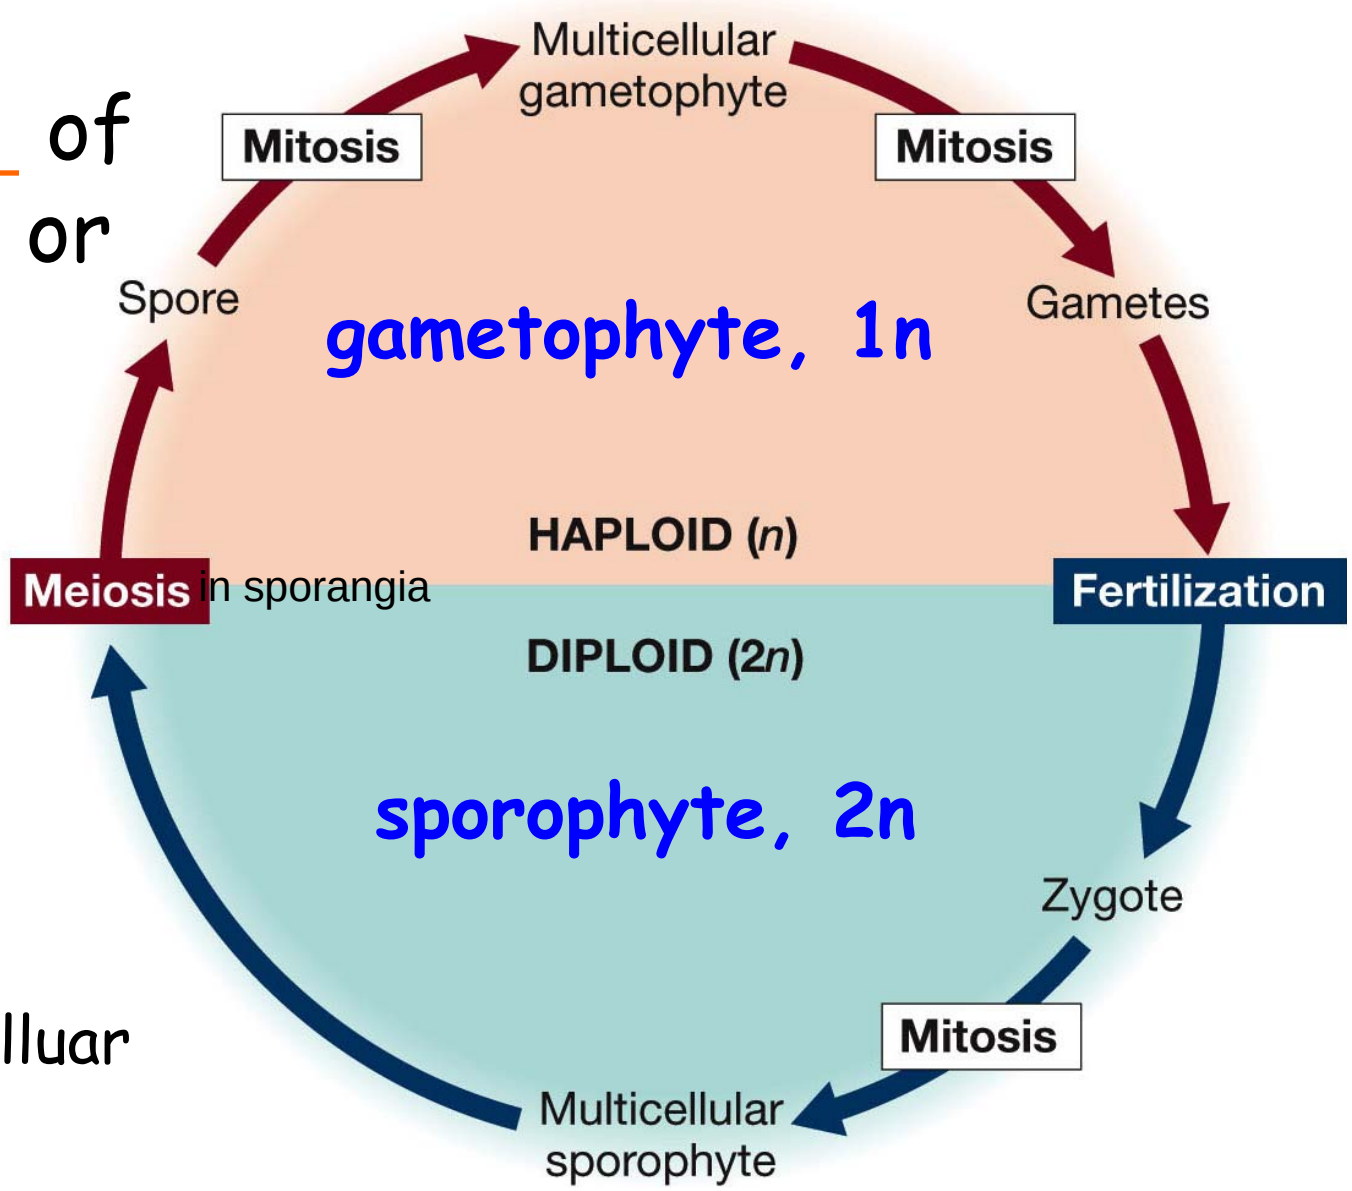
Hornworts

Anthoceros sp.

Mosses

Alternation of Generations

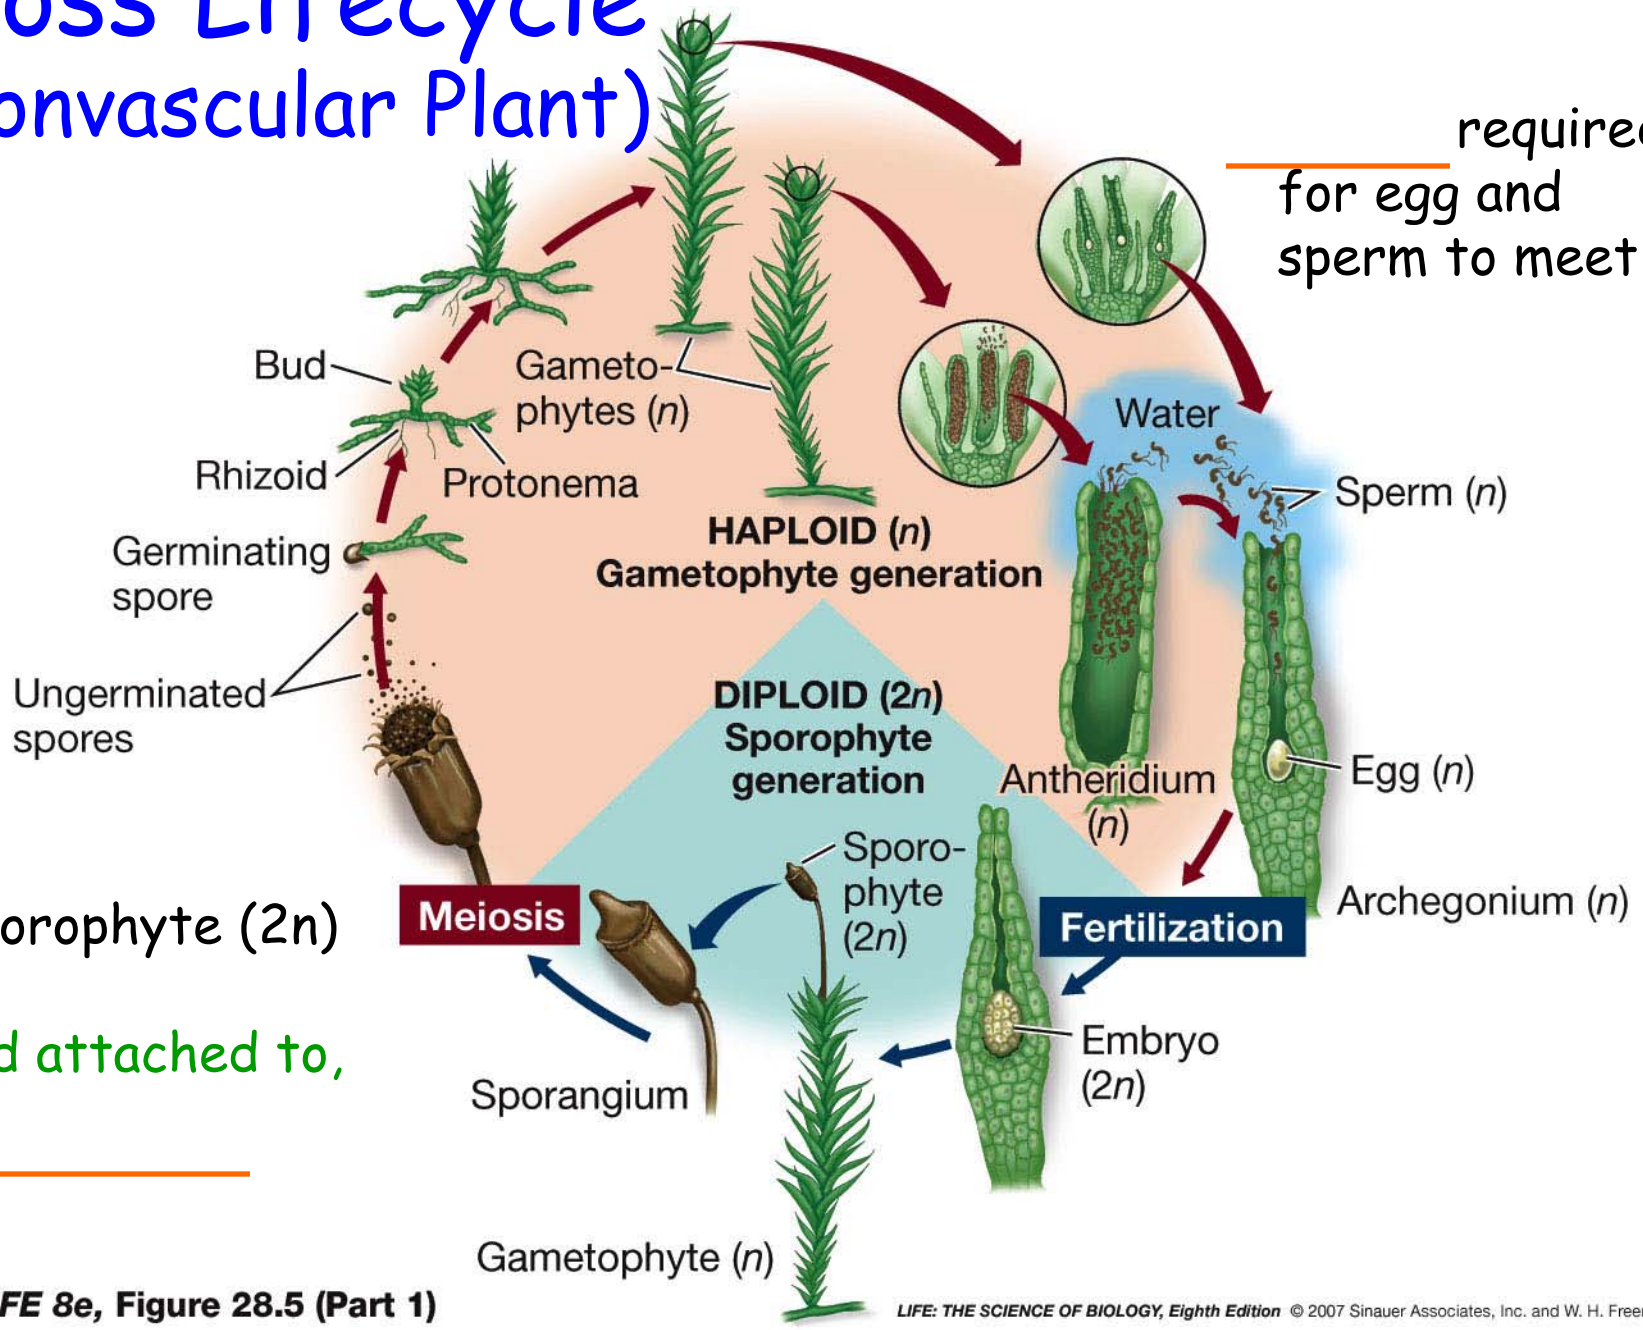
and _____ of gametophyte or sporophyte changes



All plants have alternation of generations (= multicellular haploid & multicelluar diploid)

Moss Lifecycle (Nonvascular Plant)

_____ required for egg and sperm to meet



Sporophyte (2n)

and attached to,

_____

LIFE 8e, Figure 28.5 (Part 1)

Nonvascular: Gametophyte Dominates

In nonvascular plants:

gametophyte is larger, longer-lived, and more self-sufficient than the sporophyte.

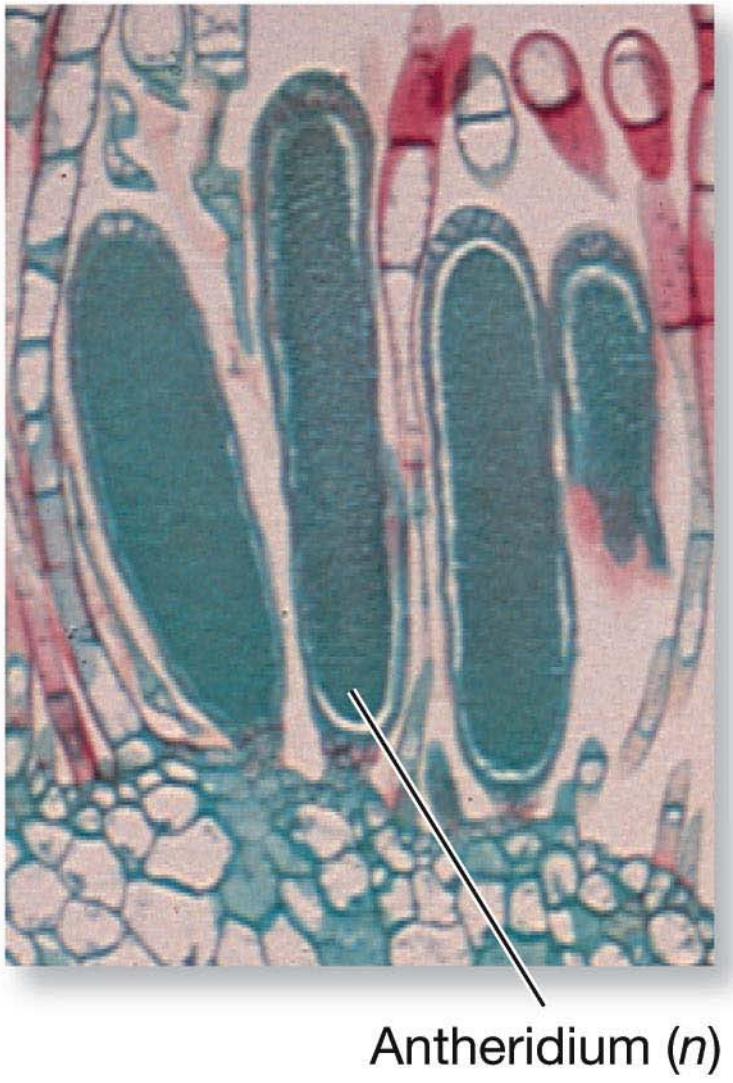
gametophyte generation is _____ .

sporophyte may or may not be photosynthetic, but is always nutritionally dependent on the gametophyte, and is permanently attached.

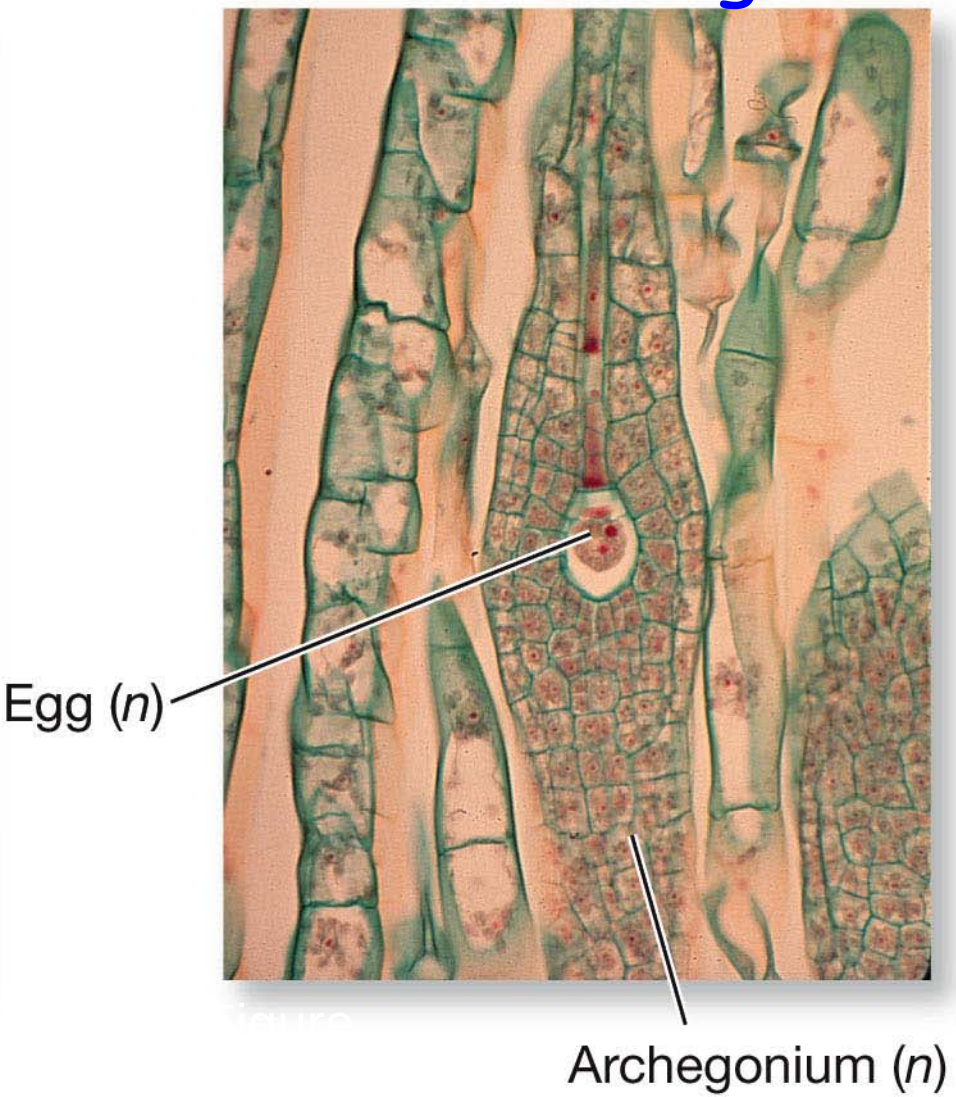
_____ of the _____ generation is a major theme in plant evolution.

Nonvascular Plant Reproduction

Male: antheridium



Female: archegonium



Nonvascular Plant Reproduction

Base of archegonium grows to protect embryo during early development.

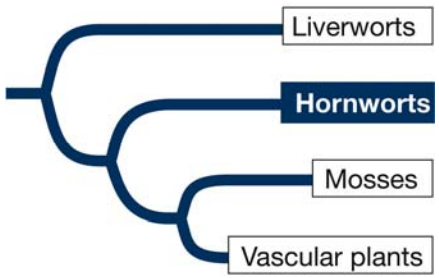
(land plants aka **embryophytes**)

Nonvascular Diversity

Hornworts: **Anthocerophyta**—100 species.

Gametophytes are flat plates of cells.

Have stomata, which do not close.



Hornwort cells have a single, large chloroplast.

The sporophyte has no stalk; but has a basal region capable of infinite cell division. Sporophytes can grow up to 20 cm.

Hornworts have internal cavities filled with nitrogen-fixing cyanobacteria.

Life cycle of a moss

Video 28-3

Mosses are _____ group to _____ plants

Moss…

Sphagnum grows in swampy places.

The upper layers of moss compress lower layers that are beginning to decompose, forming *peat*.

Long ago, continued compression led to the formation of _____.

***LIFE 8e*, Figure 28.15**

Navajo Power Plant, Page, AZ

Paleozoic: Carboniferous

- Large glaciers and swamp forests of treeferns and horsetails.

- Fossilized forests formed the _____ we now mine for _____.

Vascular Plants Arose from Nonvascular

Recently, fossilized fragments of ancient liverworts have been discovered.

Vascular Plants Comprise Seven Clades

10 clades of land plants:

Nonvascular (3 clades)

-liverworts, hornworts, and mosses

-paraphyletic group

Vascular plants, or *tracheophytes* (7 clades)

-conducting cells called **tracheids**.

-monophyletic group

Seedless Vascular Plants

TABLE 28.1

Classification of Land Plants

	GROUP	COMMON NAME	CHARACTERISTICS
	NONVASCULAR PLANTS		
1	Hepatophyta	Liverworts	No filamentous stage; gametophyte flat
2	Anthocerophyta	Hornworts	Embedded archegonia; sporophyte grows basally (from the ground)
3	Bryophyta	Mosses	Filamentous stage; sporophyte grows apically (from the tip)
	VASCULAR PLANTS		
4	Lycophyta	Club mosses and allies	Microphylls in spirals; sporangia in leaf axils
5	Pteridophyta	Horsetails, whisk ferns, ferns	Differentiation between main stem and side branches (overtopping growth)
	SEED PLANTS		
	Gymnosperms		
6	Cycadophyta	Cycads	Compound leaves; swimming sperm; seeds on modified leaves
7	Ginkgophyta	Ginkgo	Deciduous; fan-shaped leaves; swimming sperm
8	Gnetophyta	Gnetophytes	Vessels in vascular tissue; opposite, simple leaves
9	Coniferophyta	Conifers	Seeds in cones; needle-like or scale-like leaves
10	Angiosperms	Flowering plants	Endosperm; carpels; gametophytes much reduced; seeds within fruit

Note: No extinct groups are included in this classification.

Traits of Vascular Plants

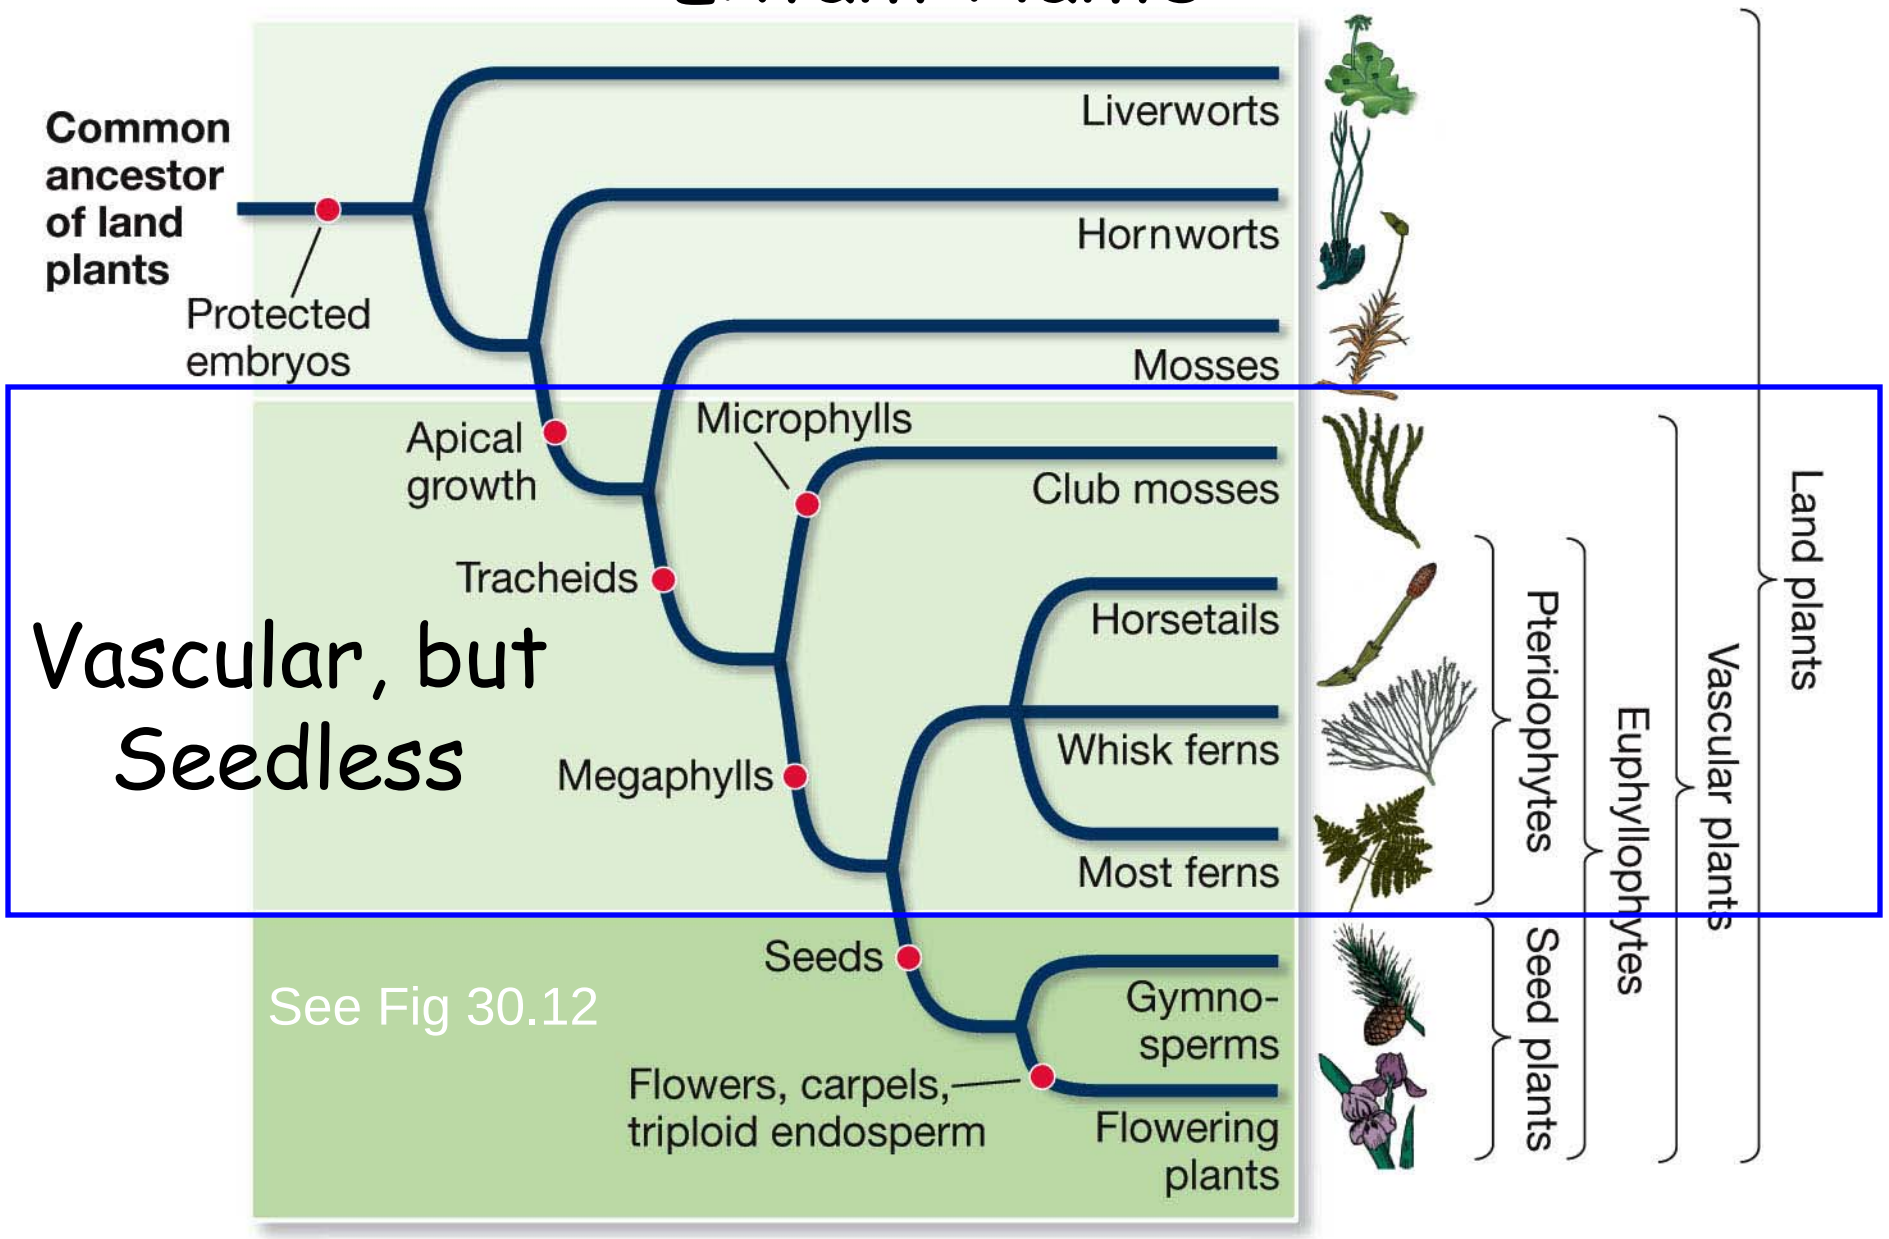
The **vascular system** consists of tissue specialized for the transport of materials.

_____ conducts water and minerals from soil up to aerial parts of plant. Some cells have *lignin*—provides support.

Tracheids are the main water-conducting element in xylem. Angiosperms have tracheids plus a more efficient system of vessels and fibers.

_____ conducts products of photosynthesis through plant.

Extant Plants



Vascular, but Seedless

See Fig 30.12

***LIFE 8e*, Figure 28.7**

Evolution of Vascular Plants

Vascular plants have a branching,

Mature sporophyte is nutritionally independent from the gametophyte.

Still must have water for part of the life cycle—for the flagellated, swimming sperm.

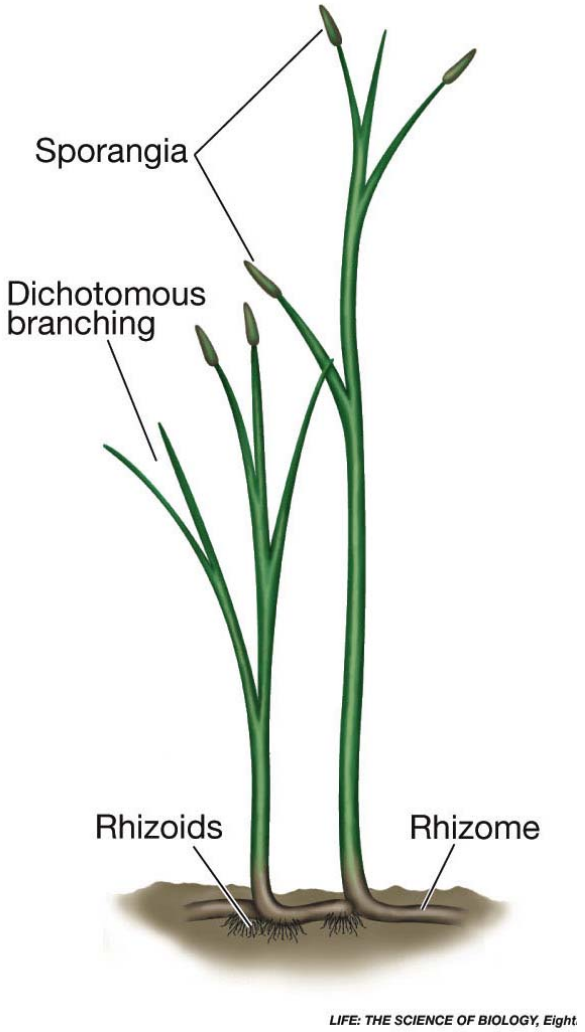
Evolution of Vascular Plants

Earliest vascular plants (now extinct):

Rhyniophytes (Silurian) had dichotomous branching, but lacked leaves and roots.

They were anchored by **rhizomes** (horizontal portions of stem) and **rhizoids** (water-absorbing filaments).

Earliest vascular plants _____



Evolution of Vascular Plants

Lycophytes appeared in the Silurian.

Pteridophytes appeared in the Devonian.

These groups had true roots and leaves, and two types of spores.

Overtopping evolved --new branches grow beyond the others—an advantage in the competition for light

Evolution of Vascular Plants

Leaf: a flattened photosynthetic structure arising from a stem or branch; has true vascular tissue.

Two types: microphylls and megaphylls.

Evolution of Leaves

Small megaphylls first appeared in the Devonian. Large megaphylls did not appear until the Carboniferous.

One theory: high CO_2 concentrations in the Devonian prevented development of *stomata*.

Stomata allow heat to be lost by the evaporation of water. Large leaves with no stomata would have resulted in _____.

Evolution of Vascular Plants

Horsetails: Fifteen species in one genus—*Equisetum*.

Silica in cell walls—"scouring rushes."

Have true roots

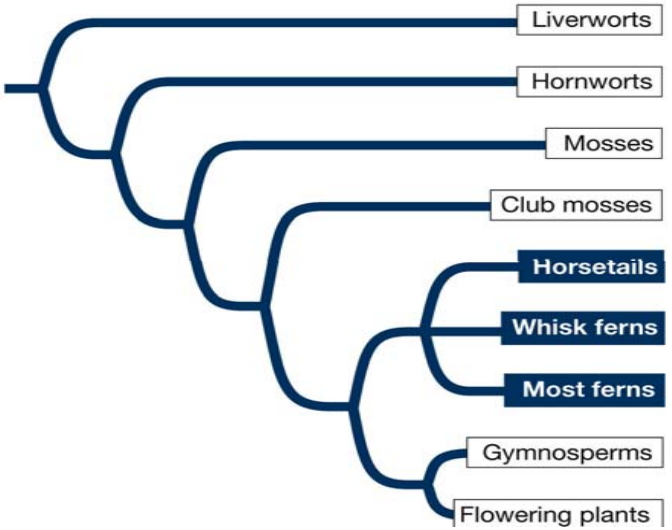


Figure 28.17 Horsetails

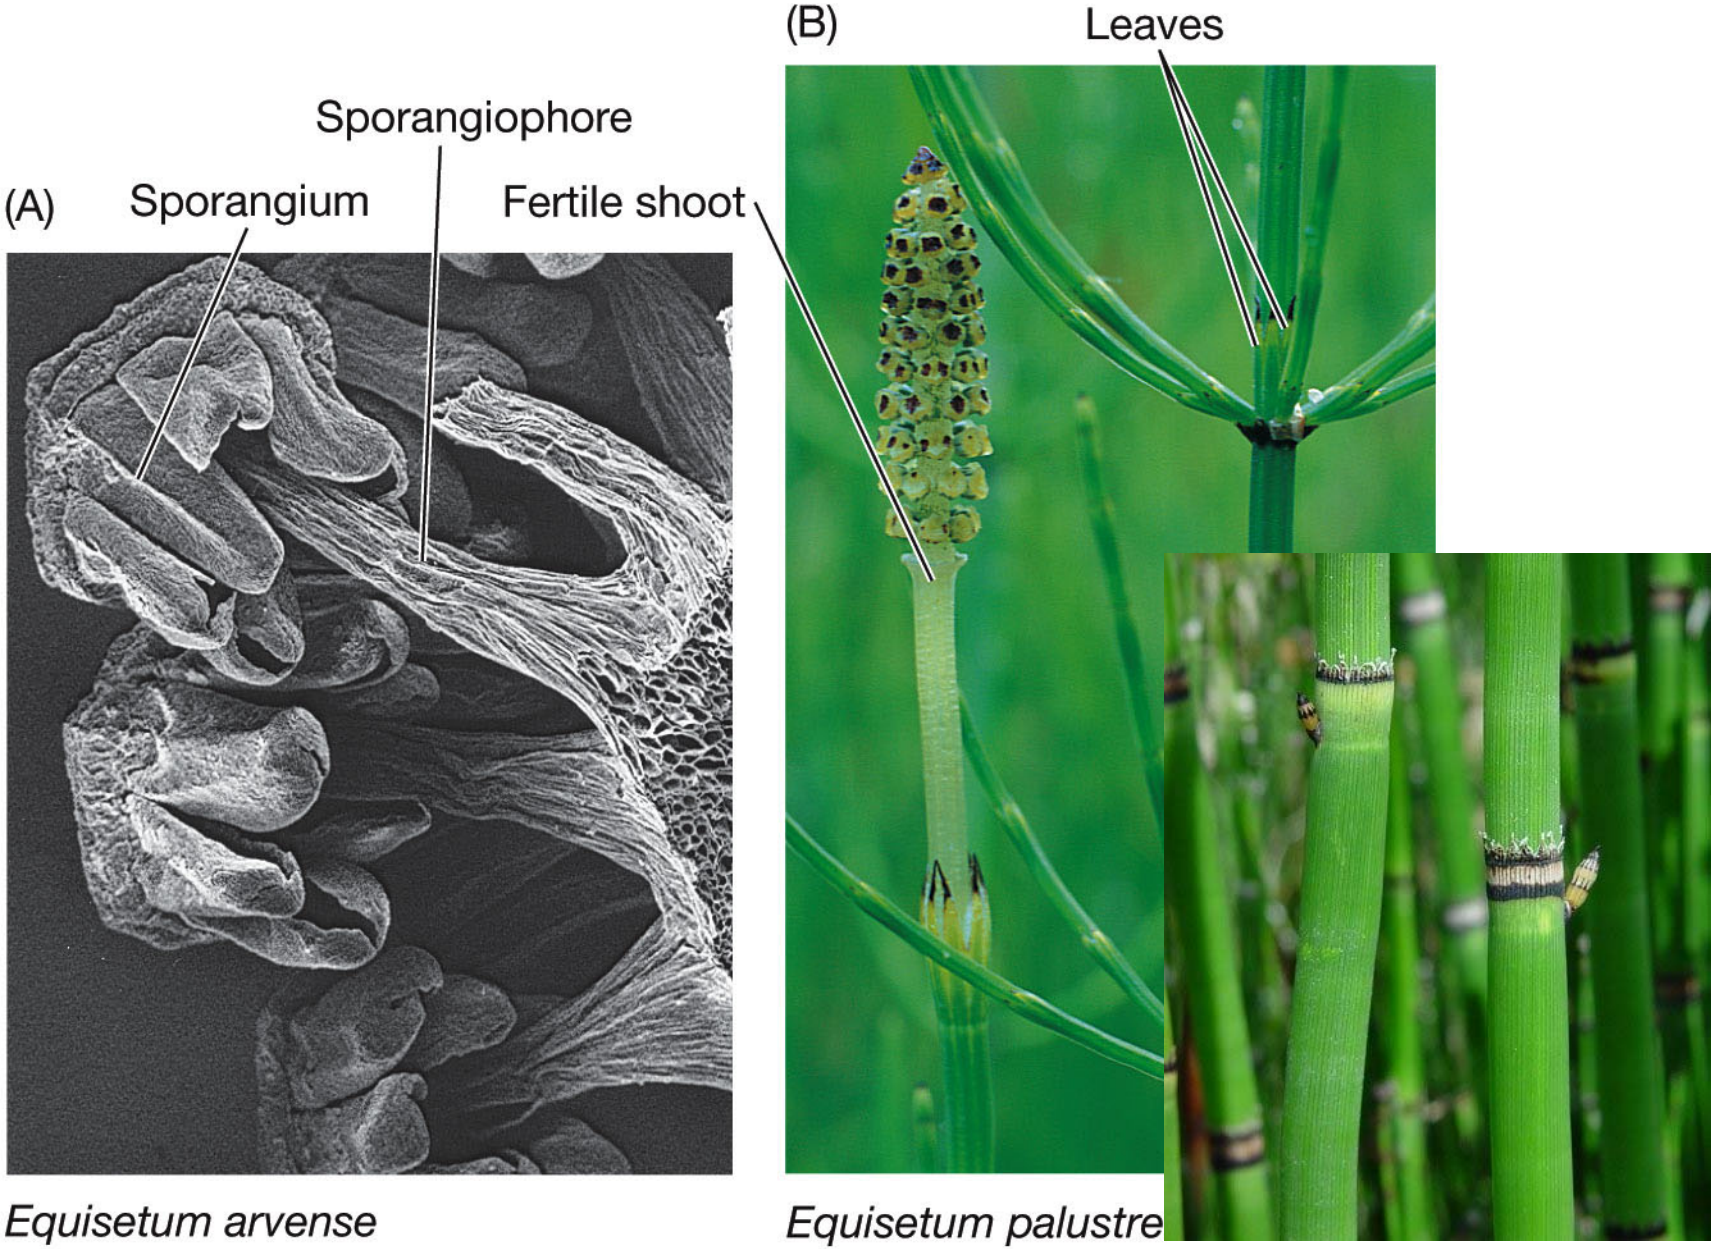


***LIFE 8e*, Figure 28.17**

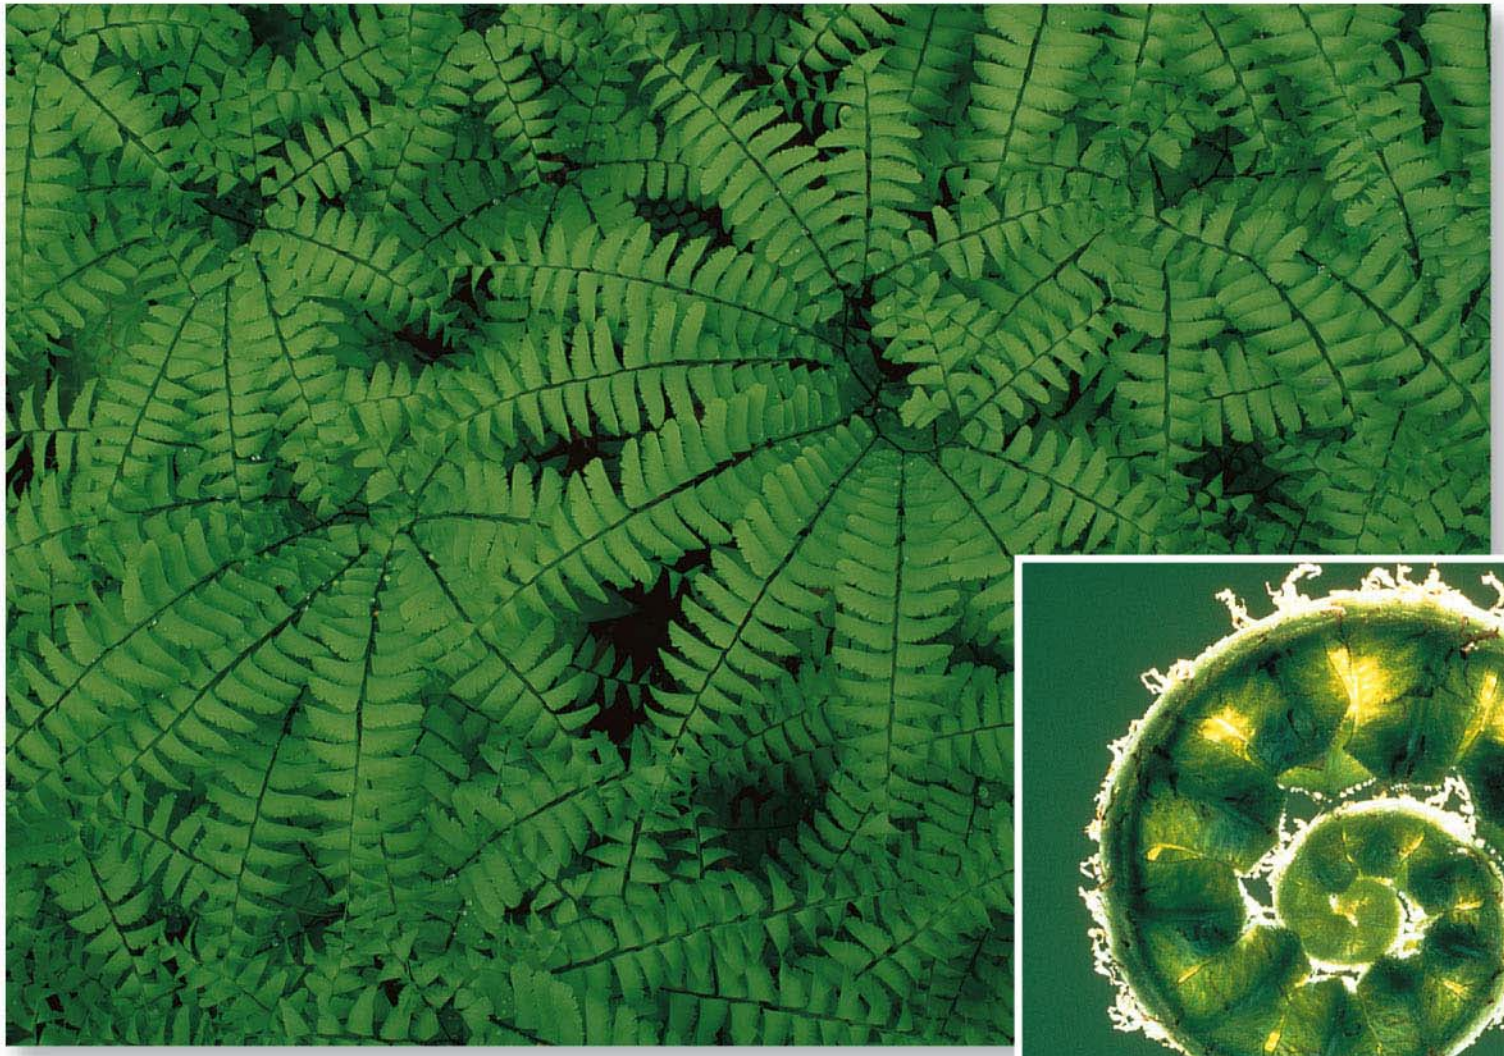
Evolution of Vascular Plants

Ferns: 12,000 species. About 97 percent are in a clade—leptosporangiate ferns—sporangia walls only one cell thick, borne on a stalk.

Sporophytes have true roots, stems, and leaves.

Figure 28.19 Fern Leaves Take Many Forms

(A)



Adiantum pedatum

(B)

***LIFE 8e*, Figure 28.19 (Part 1)**

Ferns…

Most ferns are in shaded, moist environments.

Tree ferns can reach heights of 20 m.

Sporangia occur on undersides of leaves in clusters called *sori*.

Some genera have a tuberous gametophyte that depends on a mutualistic fungus for nutrition.

Life cycle of a fern

Video 28-5

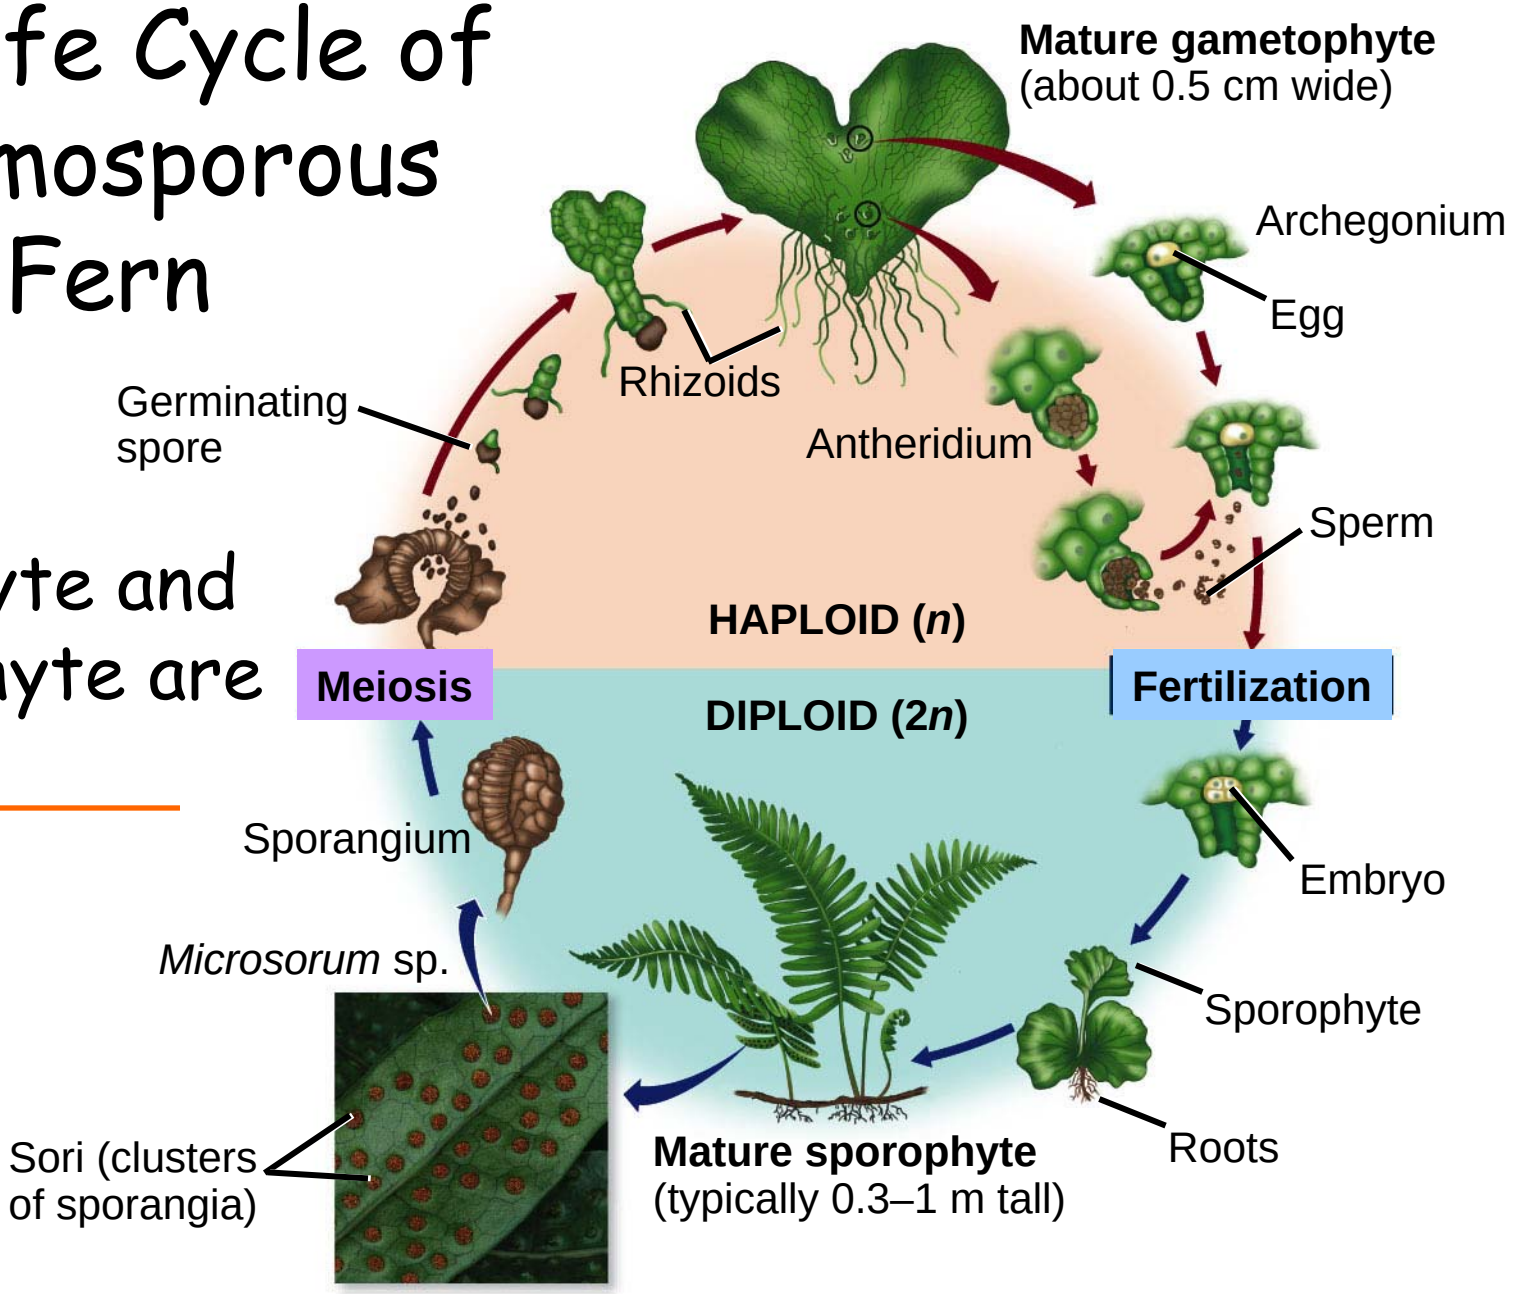
***LIFE* 8e, Figure 28.19 (Part 1)**

The Life Cycle of a Homosporous Fern

Sporophyte and Gametophyte are each



LIFE 8e, Figure 28.20

Ferns…

DNA research suggests that diversification of modern ferns is fairly recent.

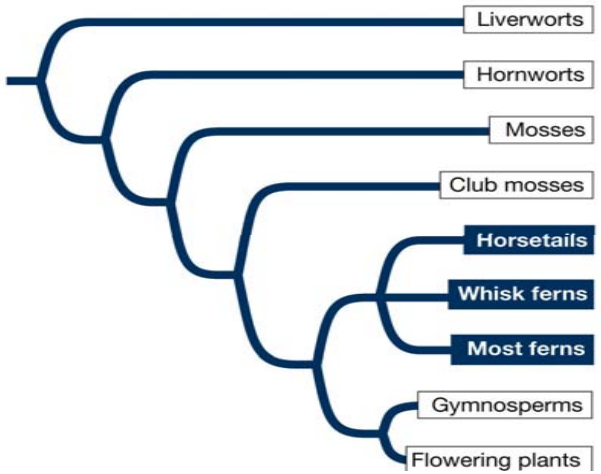
Ferns may have taken advantage of shady environments created by angiosperm trees.

Early Vascular Plants

During the Permian, the continents came together to form Pangaea.

Extensive glaciation occurred late in the Permian.

Lycophyte–fern forests were replaced by gymnosperms.



Bristlecone Pine

If you could imagine a living tree as old as the pyramids of Egypt, what do you think it would look like? It would look like a bristlecone pine, *Pinus longaeva*, the _____ known tree species in the world.

The bristlecone pine only lives in scattered, arid mountain regions of six western states of America, but the oldest are found in the Ancient Bristlecone Pine Forest in the White Mountains of California. There the pines exist in an exposed, windswept, harsh environment, free of competition from other plants and the ravages of insects and disease. The oldest bristlecones usually grow at elevations of 10,000 to 11,000 feet.
